

I am attaching an update that I have done to the English language Adult Autism Assessment Excel spreadsheet. I have been using the tool for 3 years as a family specialist physician in Calgary, Alberta, Canada, to support my diagnosis of Autism Spectrum Disorder, focussed on the adult diagnosis of people who would likely have met the older Asperger's Label.

On updating the sheet, I have only made cosmetic changes and have not modified the data boxes related to the AQ and EQ questionnaires. I have broken down each section of the Class Clinic Criteria and applied them to the DSM 5 Autism Spectrum Disorder so that a user can see where each box applies in the new label. I found an error on how question AQ 31 reads on the spreadsheet, so included a note of correction (rather than modifying the dataset). I have also added sections for typing notes relevant to the individual, as I found it more difficult to be switching back and forth between various programs to take such notes. I have also added somewhat redundant notes throughout on the DSM 5 ASD changes.
